

PMS Design Review v2

Mockup Tech Stack

- HTML5
- CSS3
- JavaScript
- React 18 / React DOM 18
- Babel

What We Would Use for the Implementation

- React / React DOM 19.x
- TypeScript
- SCSS
- Vite
- Customized MUI components
- ECharts (for Sankey charts with a horizontal layout on the **Fund Flow** page)
- Recharts or MUI charts for progress bars and pie charts
- TanStack Table for nested and highly customizable tables (possibly; not certain at this stage)
- Existing components that can be reused with some modifications: pms-button, pms-tag, pms-dropdown, etc.

Summary

Overall, I personally prefer this version of the PMS design. The structure feels more organized, and the pages appear to have a clearer and narrower scope of responsibility.

As far as I can tell, there is less overload from multiple parallel live processes. Charts are generally placed on dedicated pages where they make the most sense. I did not notice any significant duplication of data. Most tables could likely be implemented by reusing the same table component with different configurations.

It's difficult for me to evaluate the widgets from a business perspective or determine whether they contain all the necessary information. However, my overall impression is that the data and tools are now organized much better.

Comments and Questions

Header

- There is a currency switcher in the header with three options: USD, USDC, and BTC.
- I'm not entirely sure why these three options were chosen. Is the intention that selecting one of them recalculates and displays all monetary values in the chosen currency?
- If so, I believe the practical implementation would involve fetching all relevant data from the backend using a parameter such as:

`symbol = ${selectedSymbol}`

and receiving all values already converted on the server side. Performing these calculations on the frontend in JavaScript introduces the risk of precision issues.

- The design for the Info Center is missing. At the moment, the header only contains a notification bell with a red indicator showing that messages are available, but there is no design for the Info Center modal itself or for toast notifications. We already have an older implementation of this system. It may be worth revisiting it to determine whether it can be reused in the new design as-is or with only minor adjustments.
- It's also unclear what the refresh action in the header is supposed to do, and how it differs from the additional refresh button on the Overview page (sits next to `last updated`).

Overview

- We have sections called **Critical Ops**, **Monitoring**, **Management**, and **Admin**, and there are buttons with the same labels. What exactly are these buttons supposed to do? Are they anchors that quickly scroll the page to the corresponding section? Maybe it make sense to convert these sections into tabs instead like we had in previous design project.
- The **Compare to Previous Period** toggle appears to require fetching additional data and rerendering several widgets, particularly charts. A notable example is **P&L Destination**, where one pie chart is displayed inside another. In theory, this should be achievable with Recharts. We can explore and try.
- For **Trades per Strategy**, I don't fully understand the tooltip saying "*Click a bar to filter.*" The widget appears straightforward. It displays the number of trades per strategy. However, what exactly should clicking a bar filter or display? This could simply be a Claude hallucination. The same question applies to **Active Sagas by Type**.

Positions

The primary question here is what should happen when the user clicks:

- Export
- Hedge Calculator

- +New Order

Additionally, in the table header, **Open**, **All Venues**, and **All Assets** are somewhat inconsistent visually. **Open** looks like a filter chip, while the other two appear to be buttons. If they are all intended to be filter chips, the design is missing a mechanism for adding or managing those filters.

Strategies

The page looks well-designed overall and feels clean and easy to navigate. However, the expected behavior for the **Compare** and **New Pool** actions is not currently defined. We will need a UI/UX solution for both interactions.

For **Compare**, it is unclear whether the user should be redirected to a dedicated comparison view, presented with a modal dialog etc.

Similarly, for **New Pool**, the design does not specify whether pool creation should be handled through a modal, a drawer, or a separate page. Additional design details would help clarify the intended user flow.

Strategies -> {strategy details}

The design is missing screens for:

- Edit Allocation
- Bot Console

Bots & Sagas

What should happen when the user clicks **View All Errors**? Should the widget above expand somehow, or should a modal window or dedicated page be opened?

The same question applies to:

- Rebalance
- Release Stale Locks

Authentication

There is still an open question regarding wallet-based authentication. Where should the wallet connection button be located, and what should the user see before logging in?
