

1. General Remarks

1.1 Refresh Button

The refresh button in the header and on the Overview page should be removed. Updating critical data via a manual refresh button is a bad approach. All critical information in the admin panel must be updated in real time via a WebSocket connection.

1.2 Notification Center Design

The new design still lacks a fully functional Notification Center. This feature needs to be thoroughly thought through so that users can conveniently view notifications about critical events (system errors, bot status, withdrawal confirmation requests, etc.) and be able to respond to them quickly.

1.3 Modal Windows Design for Action Buttons

Most pages have action buttons at the top (e.g., + New order, Cancel all, Sweep to treasury, Hedge calculator). However, no modal windows or side panels have been designed for them yet – the ones that should open on click. This interface needs to be carefully designed, as there is currently no clear understanding of how this functionality should look and work.

2. Overview Page

2.1 Page Data Overload and Component Structure

I don't like that all the data is again displayed as one continuous wall on a single page. The data is split into logical blocks, but they should be moved into separate tabs for convenience, to avoid excessive scrolling.

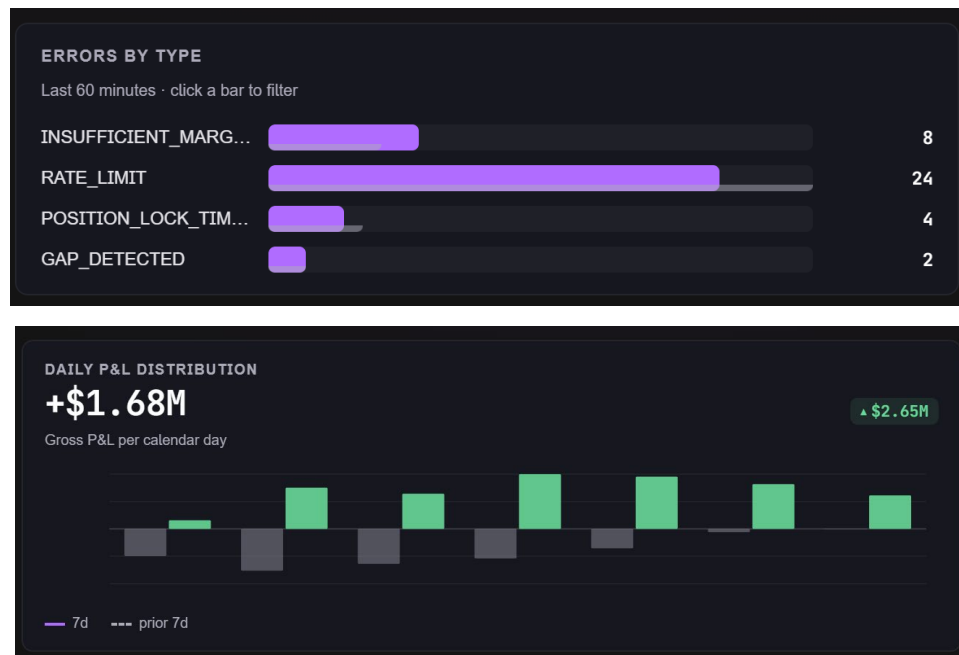

It's also worth thinking more carefully about what truly needs to be shown on the Overview, and which data is less critical and can be moved to the corresponding sidebar pages. This will help keep the main screen clean and show only business-critical information.

2.2 Lack of Interactivity in Operational Blocks

The Pending withdrawals and Transfers pending approval blocks should include a quick-navigation button to the page where the corresponding operations can be performed, or those actions should be added directly to these tables on the Overview. Right now they only display information, and to act on it the user has to manually search for the relevant tables in the menu.

2.3 Implementation of the “Compare to previous period” Feature

This feature needs further work, as enabling it currently makes the interface feel cluttered. The extra text in cards (e.g., prev period: 42) creates unnecessary visual noise – a better, cleaner solution should be designed, for example showing only the delta rather than duplicating previous values. In addition, the comparison display on charts needs to be fixed: right now the grey elements simply overlay the primary data, making the charts hard to analyze at a glance.

2.4 Uninformative “Top positions” Table

The Top positions table in section 02 Monitoring is very uninformative. If I understand correctly, the bot does not hold positions for long, so displaying the current top open positions on the main screen does not make much sense. Besides,

the table contains too little position data to be useful for any meaningful analysis. It may be better to display the most recently closed positions instead of this block.

TOP POSITIONS

SOL	OKX	LONG	\$1.50M	+\$136.7K	+10.01%

3. Positions Page

3.1 Unclear Filter UI

The row of filters below the tabs (Open x, All venues, All assets, Hedged pairs) has an inconsistent visual style, making it unclear how to interact with them. All filter elements should be brought to a unified standard: use classic Dropdowns with appropriate icons for parameter selection (status, venue, asset), and use a Toggle or checkbox for specific options like Hedged pairs.
