PMS Design Review

Overview Page

- **Errors By Type widget** — all bars are the same color. It might make sense to color-code them by severity. Enabling "compare to previous period" toggle adds an extra line to this widget. If that's informative, it's fine. If this is something Claude added simply because it could, we should reconsider whether it actually provides any real value here.
- **Pending Withdrawals** — clicking "Review transfers" navigates to a separate Transfers page. That could work, but it might be better to design a more fully-featured widget here instead, so we don't have to keep switching pages for every review. The adjacent "Pending Approval" widget behaves exactly the same way and leads to the same page. Having to monitor two widgets and jump between pages to take action will likely become frustrating very quickly.
- **Reconciliation findings** — the table is detailed and offers two actions: Inspect and Resolve. Clicking opens a modal with additional record data and action buttons. However, there's also a button that leads to a separate page offering what seems to be a completely different view of the same issue. Honestly, I didn't understand what value the separate Reconciliation page adds, or whether it makes sense to use it independently of the widget on the Overview page.
- **Admin tab, "Unusual & Failed Audit Events" table** — leads to the Admin page. I assume this is meant to allow a response to a flagged issue in the log, but I still don't understand exactly how. The corresponding tab on the Admin page appears to be the Audit Log, which doesn't seem to support any actions at all. In short, I didn't understand the flow of this widget.

Positions

Reached by clicking the table on the Overview page. The main concern here is understanding what the "Hedge calculator" and "+New Order" buttons are supposed to do — what should appear or happen when they're clicked.

Orders & Executions

This appears to be a table showing real-time operations. What are the "Pause" and "Cancel All" buttons supposed to do? Stop all bots? It could be quit dangerous action buttons. And we should add validation flow to it.

Strategies

Looks fine overall. Missing a design for the "add new pool" form (or should this be "add new strategy"?).

The small "Open Detail" button at the bottom of the strategy card doesn't make sense — the card is already clearly clickable on its own.

Fund Flow

What does the "+New Withdrawal" button do? Can we initiate the operation directly from here? Again, a form design is missing for this action.

Investors

It probably makes sense to add the approve deposit/withdrawal action buttons to the Activity Log table, so we can respond to a specific operation users initiated if something goes wrong or it requires additional attention per procedure. In other words, the action should be tied to the event. Right now, the "Manual Deposit" and "Approve Withdrawal" buttons seem to exist in isolation. Though "Manual Deposit" may still make sense in certain cases I guess.

Counterparties & Venues

Missing a design for the "Add Venue" form.

Reports & Statements

It would probably be good to add proper inputs here — for example, selecting a period, strategy, report type, etc. Currently, the table shows various reports (Monthly NAV Statement, Risk & Compliance Summary, Strategy 3 Stress Scenarios, etc.), but it's unclear how these reports are actually generated. Perhaps "Generate Report" is meant to open a dedicated modal with a form for this — if so, that design is needed.

Admin

The "Download Audit (CSV)" button — does this kind of audit request really not need any form? A form for inviting users is probably needed too, even if it's just a field for pasting a wallet address. On the other hand, users could create their own accounts directly on Kemely.DApp. We should think about whether we'll actually have use cases that require this invite feature.

Notification Center

Overall looks good. Question: where does the "Notification settings" button lead? "View all events" makes sense if we plan to delete older notifications. If not, it would probably be more logical to use a "show more" approach that loads additional messages incrementally.
